Obesity is the second leading cause of preventable death in the United States. Major health risk factors related to obesity include diabetes, sleep apnea, high blood pressure and high cholesterol. Additional medical conditions such as cardiac disease, gastroesophageal reflux disease, arthritis and some cancers are also a result of, or related to, obesity. Losing and maintaining a healthy weight can help in resolving or improving these medical conditions.

The Bariatric Surgery Center at Excela Health offers Laparoscopic Gastric Bypass, the Gastric Sleeve procedure and Lap-Band surgery to aid in successful weight loss. Our team of surgeons, nurses, exercise physiologists, dietitians and psychologists can help you on the road to surgery and during your life-long weight loss journey.

If you have a body mass index (BMI) of 35 to 39 with one or more major health risks or if you have a BMI of 40 or greater, you are a candidate for bariatric surgery.
To learn more about bariatric surgery at Excela Health, register now for one of our free community meetings, held alternating months, 6 to 7 p.m.
